

Yanmar Guard Makes Workplace Safer

The popular Yanmar TF series of diesel work engines has been upgraded with the addition of a factory fitted safety guard.

Yanmar's TF series engine is a single cylinder, water cooled engine that is available in a variety of configurations from 5mhp to 14mhp.

This engine features a side mounted flywheel to which a Yanmar factory supplied power-take-off shaft can be bolted. Typically the Yanmar TF engine is used in pumping applications or to drive a variety of machinery via a vee belt.

The new safety guard is a sturdy steel design which is bolted to the TF engine in five places. The guard covers not only the spinning flywheel but also the pinion and drive on the starter motor.

In the workplace the Yanmar TF series engine now offers significant occupational health and safety benefits to workers operating this equipment.

“At Yanmar we are ever mindful that the workplace (in particular farms and agricultural sites) harbours many unforeseen dangers,” said Mike Edwards National Power Products for Yanmar diesel engines.

“With the popular Yanmar TF series now being shipped with factory fitted guards, the workplace becomes a safer environment. This guard will certainly prevent wayward hands and fingers from being caught up in the spinning parts of the engine.”

Power Equipment is the exclusive and authorised Australian and PNG Distributor of Yanmar Marine and Industrial Diesel Engines importing product from Yanmar plants in Japan, Asia, USA and Europe.
